

CivicFix

CivicFix is a mobile-first app for reporting local civic problems, tracking their progress, and helping departments manage their work queue.

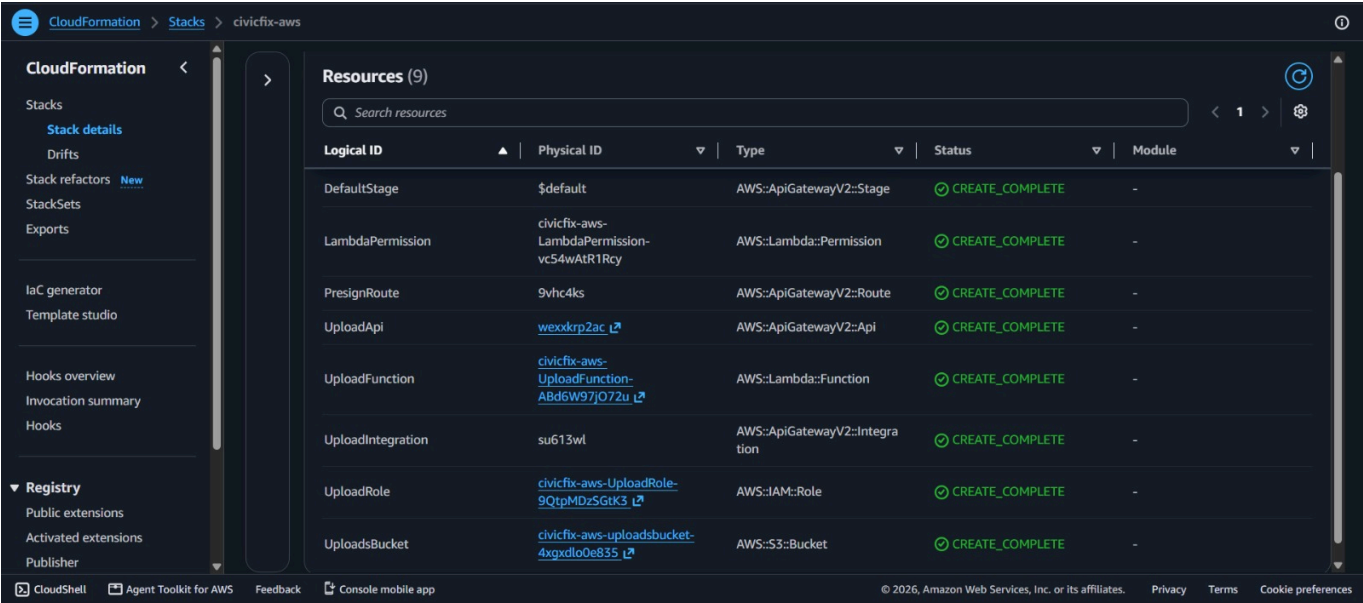

How the app works

1. A citizen creates an account and reports an issue with a category, description, location, and optional photo.
2. The report is stored in Supabase and assigned to the relevant department.
3. If a photo is included, the app requests a secure upload link and saves the photo privately in AWS S3.
4. Citizens can follow report status updates, while staff can update, resolve, or delete assigned reports.

AWS services used

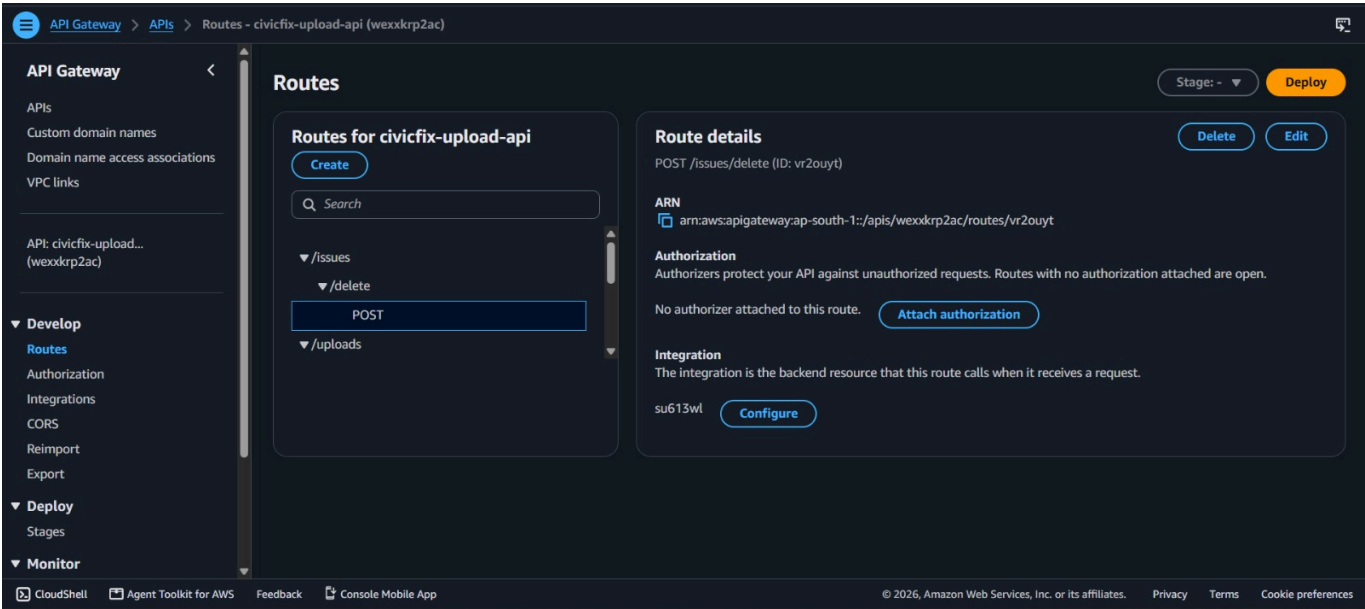

AWS CloudFormation

CloudFormation deploys and manages the CivicFix AWS resources.

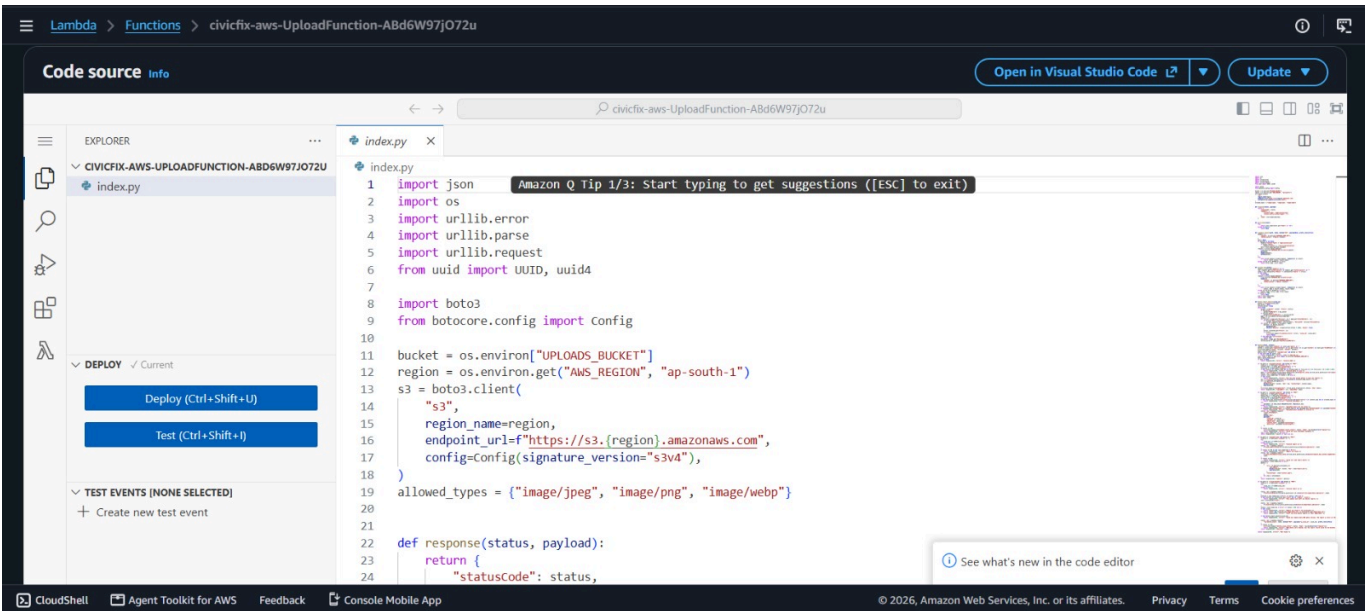

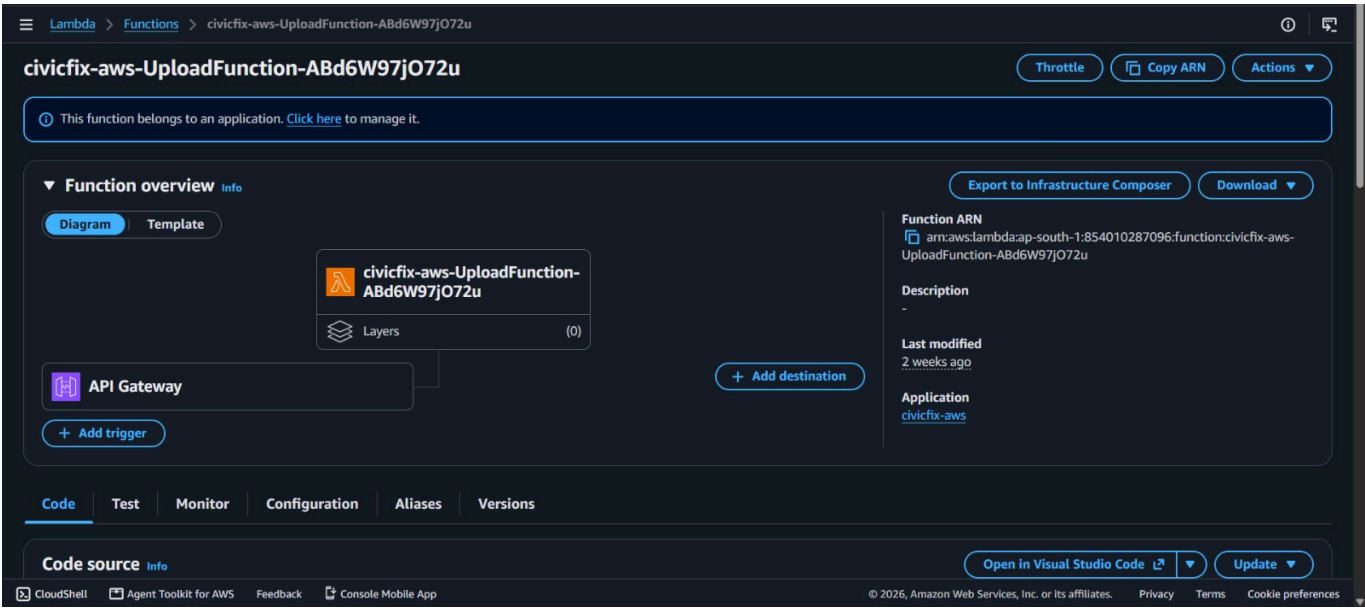

Amazon API Gateway

API Gateway exposes secure HTTP endpoints for photo upload, completion, viewing, and deletion.

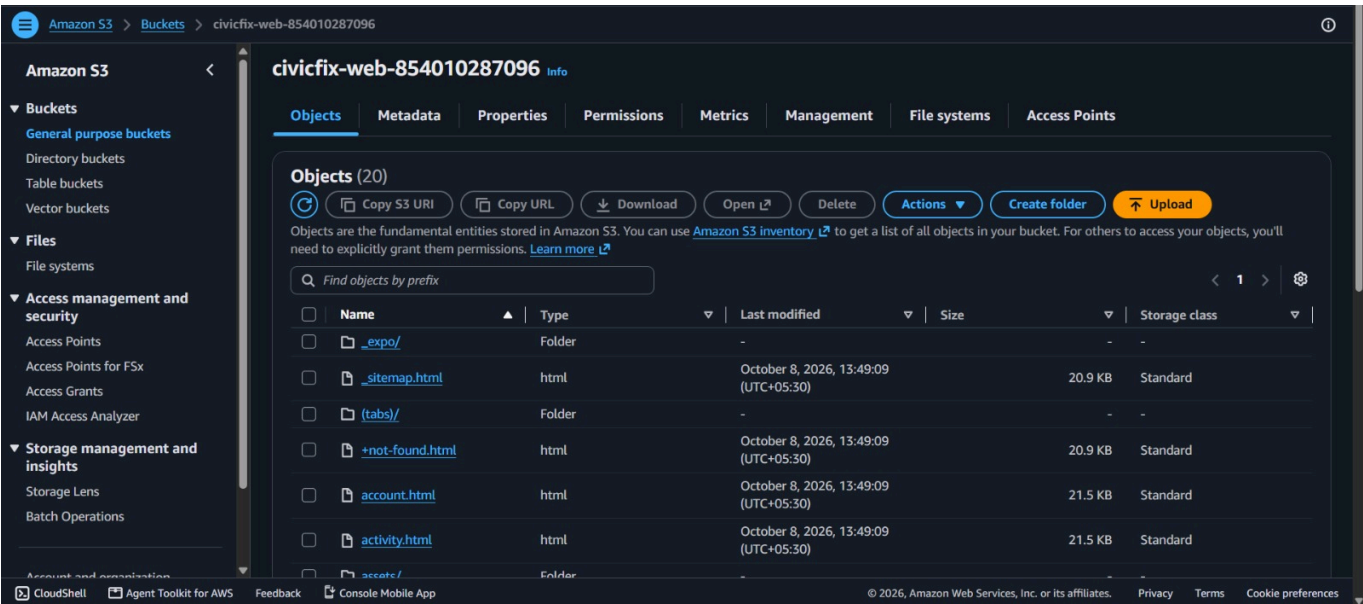

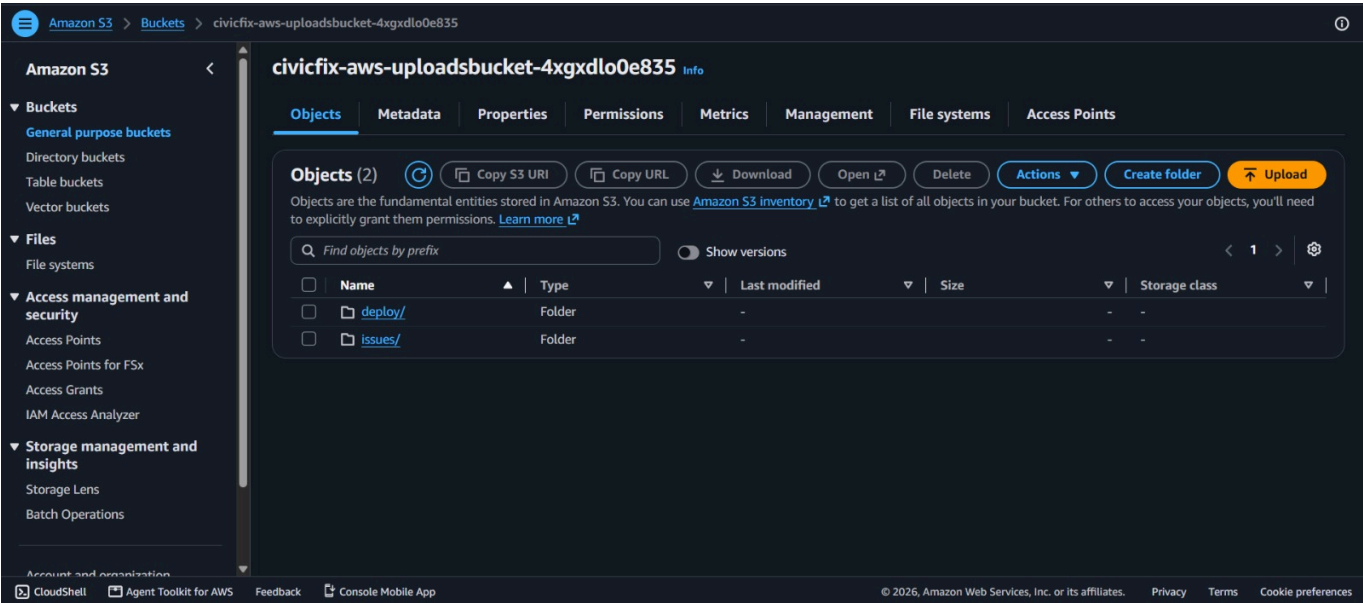

AWS Lambda

Lambda validates requests, creates short-lived S3 presigned URLs, and handles photo-related API operations.

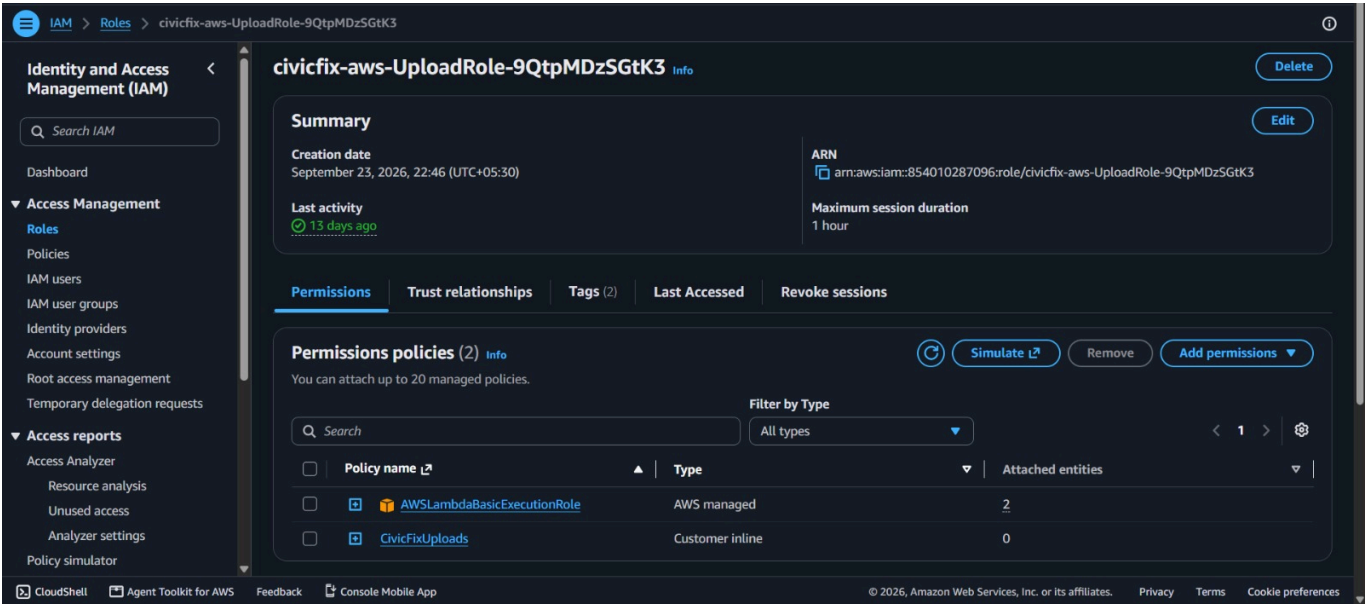

Amazon S3

S3 stores civic issue photos privately. A separate S3 bucket hosts the public web build.

AWS IAM

IAM provides the Lambda execution role and only the S3 permissions required for uploads and photo management.

App demo

- 1. Open CivicFix and create an account or sign in.
- 2. Tap **Report** and select an issue category.
- 3. Enter the problem details and location, then optionally add a photo.
- 4. Submit the report and note the generated reference number.
- 5. Open **My Reports** to track the status and updates.
- 6. Sign in as staff to open the department workspace and update the report status.
